INTRODUCCIÓN

SANA (Analysis, Notification, and Alert Service) is a complete real-time information system designed to fully meet the data protection needs of professionals and businesses alike.

SANA was designed by the **Hispacec Sistemas** team of specialists, who have extensive and proven experience in this sector. It provides information on data protection, customized according to each client's profile. Thus, **SANA** users will receive real-time information about new computer vulnerabilities that may affect their systems, as well as preventive measures and/or patches to correct them.

SERVICES

Upon subscribing to SANA, our clients will gain access to the following:

Daily e-mails, one for every alert. These messages are fully customized. Only news relevant to the client's profile would be received. Alert monitoring and notification take place in real time, **24 hours a day, 7 days a week**. Customization ensures that only specific, properly qualified, high quality information is received.

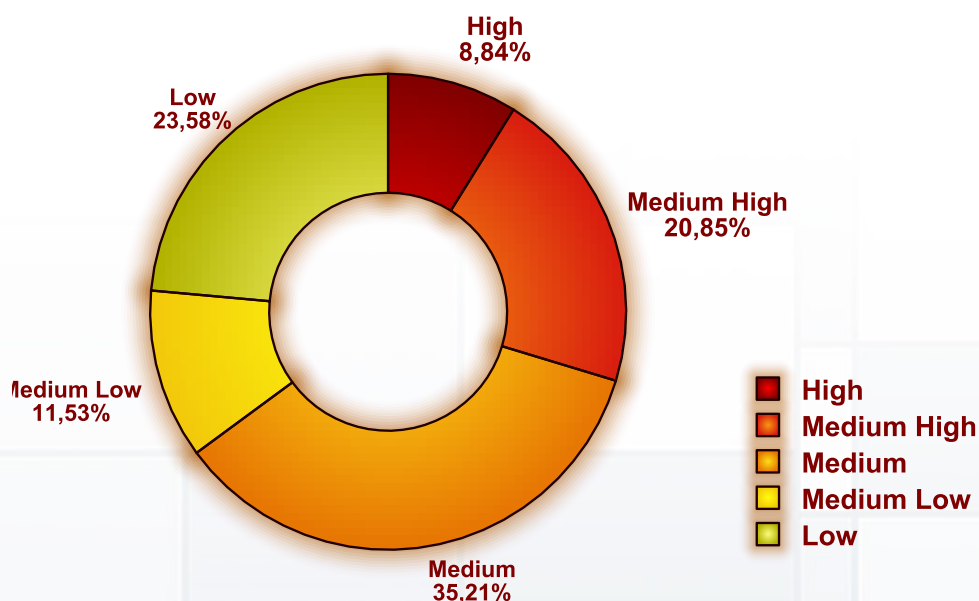

Monthly summary message, with a monthly history of alerts matching the client's profile.

Access to a **web interface** where the latest vulnerabilities, status of viruses and their spread, and news on the data security sector can be looked up. Moreover, through this interface, our clients can check historical data, perform advanced searches by product(s), obtain analysis stats and graphs, and access a wide variety of additional information resources.

Notification services can be configured in this interface: **different e-mail addresses can be designated to receive our alerts, and different cell phone numbers can be indicated for notification of the most critical alerts**. This enables our clients to respond efficiently to serious events by assigning responsibilities for different alerts (especially useful when several people are involved in security).

STATISTICS

We count with more than 5.000 alerts documented in the last 12 months

STATISTICS

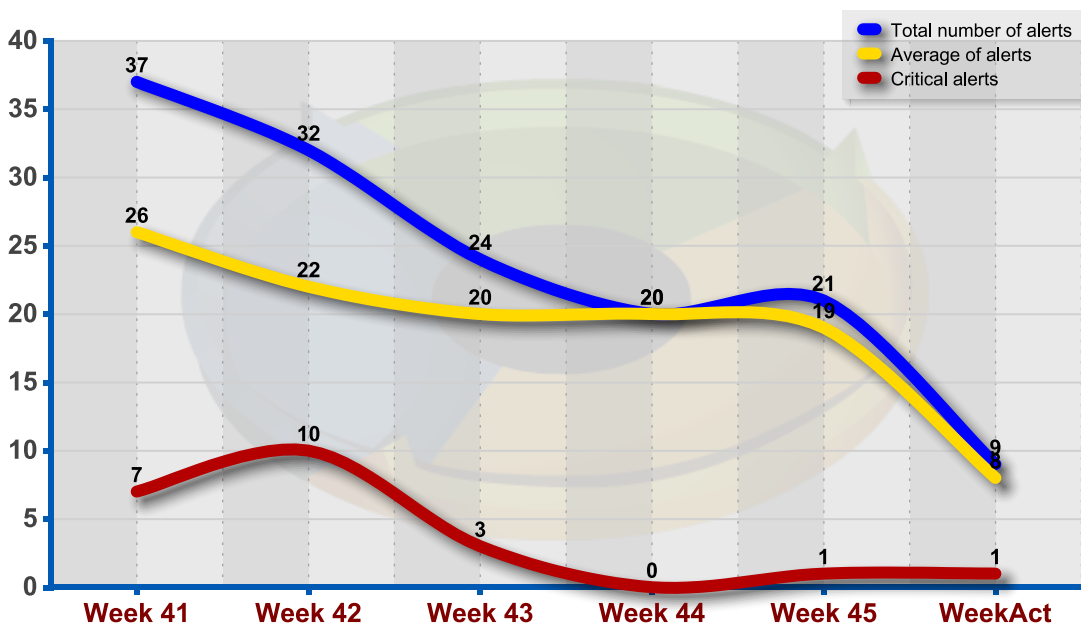

According to the latest available statistics, **S.A.N.A.** documents an average of 18,60% of counter-measures against vulnerabilities that at the moment when they appeared did not have any official patch of the manufacturer.

A large part of the alerts, exactly 4.857 (81,40%), were due explicitly to patches or to vulnerabilities that counted with updates to correct them. For the rest of these alerts, **Hispasec Sistemas** documented countermeasures and preventive additional actions in the waiting time frame till the final solution would be available.

S.A.N.A.
documents an average of 15 IT security incidents per day

Example of S.A.N.A. statistics

Number of alerts released by **SANA** during last six weeks. Blue line represents total of them. Yellow and red represents medium and critical alerts respectively. ActWeek represents alerts released this week (in real time).
